A concept masterplan for a 7.5 km sustainable riverside park which sets new standards for riverside development in Indonesia.

The concept design builds on an understanding of river morphology and riparian habitats. The ebb and flow of tides and the natural erosion, drift and sedimentation of river deposits are expressed in a rhythmic, meandering sequence of meadow, woodland and wetland. The emphasis is on creating an accessible, sustainable riverside landscape which provides a stunning setting for a prestigious riverfront development, enhanced riparian habitats and the capacity to accommodate a 100 year flood.

A network of pathways explores the riverside landscapes, connecting a series of viewpoints, formal lawns, play and events spaces. A series of gateways connect the upper terraces of the park with the adjacent waterfront development.
